4458. CONTRIBUTIONS TO THE STUDY OF WATER METABOLISM IN HEPATIC DISEASE (TIMED DIURESIS) - Contribuții la studiul metabolismului apei în hepatite. Diureza minutată - Galea G., Mincu I. and Georgescu R. Clin. Med., Spital 'Brîncovenesc', București - MED. INTERNA (București) 1958, 10/9 (1329-1340) Graphs 6

The technique of Bacques was used for a timed study of the diuresis in 59 patients with hepatic disease. In normal subjects, who have ingested 1 l. of water, the urinary excretion curve, with determinations made every 30 min., reaches its highest point of 400-500 ml. at the 2nd or 3rd miction; the whole litre is excreted within 24 hr. The liver patients, on the other hand, showed opsiguria with flattening of the excretion curve, the decrease varying with the severity and the developmental stage of the disease. The total urine excretion amounted to only 200 ml. with the maximum excretion at only 100 ml.; these modifications of the urinary excretion curve have shown a parallelism with the hepatic affection, from chronic hepatitis to decompensated cirrhosis.

"Contributions to the Understanding of the Ichthyological Fauna in the Waters of Dej Raion."

Bucharest, Natura. Seria Biologie, Vol 11, No 2, Jan-Apr 1963, pp 81-85.

Abstract [Author's English summary modified]: A brief hydrography of the Dej raion is given, discussing and describing the main species of fish found. These are seven families: Cobitidae, Cyprinidae, Esocidae, Gobiidae, Salmonidae, Siluridae, and Percidae.

Includes a map, 2 Rumanian references, and a table showing average and maximum length and weight of the various fishes in the region.
